

2/2 directional control seat valve, 3/2 directional control seat valve

Nw3 and NW6, for Water, Oil and Air

- Protection against accidental operation
- Operating magnet protected against dirt and humidity
- Operating elements can each be rotated through 90°
- Wear parts are easily accessible and can be replaced quickly

TECHNICAL DATA

The valves are used for water or oil hydraulic control systems. They can also be used as pilot-control valves.

Type

Directional control ball seat valve

Connections

Plate mounting with O-ring seal on request available with connection plate
Connection thread
NW3 = R1/4" or 1/4" NPT
NW6 = R3/8" or 3/8" NPT

Medium

Water, oil or air must be specially mentioned when ordering

Viscosity

1 to 300 cSt

Ambient temperature

Depends on control element, see table „Technical data of control elements“, higher temperatures on request

Seals

NBR, other seal materials available upon request

Sealing

Ball on seat

Pressure range

0 to 320 bar (630 bar)

for 3/2 dir.:

The pressure in connection „R“ must not exceed 50% of working pressure

Switching time

Depends on operating pressure and operating temperature (see table: technical data of control elements)

Fitted position

Any

Flow direction

2/2W: From „P“ to „A“

3/2W: From „P“ to „A“ or from „A“ to „R“

the connections „P“, „A“, and „R“ must not be mixed up

Flow rate for liquids

Max. 20l/min at NW6

Max. 5l/min at NW3

Operating modes

Electric, hydraulic, pneumatic, mechanical or manual operation

Materials

All parts coming into contact with the flow medium are made of corrosion resistant materials

Special features

The valve is characterized by fast response times. The solenoid plunger of the electromagnet is dual-supported and thus protected against wear. By means of a diaphragm seal between the pushrod and the solenoid plunger chamber the control electromagnet is protected against dirt and humidity. The arrestable manual operation device can be accessed by removing the type plate and is thus also protected against any accidental operation. The electric magnet and all other control elements can each be rotated through 90°. All wear parts are easily accessible and quick to replace.

VALVE VERSION “POSITIVE“

(Valve is closed when magnet is de-energized)

Fig. 1 (electromagnet de-energized):

The pressure spring (2) presses the valve ball (4) via pushrod (3) into the valve seat (5). The pressure of the medium in infeed “P” supports the pressure spring action (2). Thus the passage from infeed “P” to working line “A” is blocked.

Fig. 2 (electromagnet energized):

When the electromagnet (1) is switched on, the solenoid plunger (6) presses the valve ball (4) - via lever (7) and pushrod (8), and against the force of the pressure spring (2) and the pressure of the medium in the infeed “P” - from its valve seat (5). Now the passage from infeed „P“ to working line „A“ is clear.

B	Zulauf	5	Ventilsitz
1	Elektromagnet	6	Tauchanker
2	Druckfeder	7	Hebel
3	Stößel	8	Stößel

VALVE VERSION “NEGATIVE“

(Valve is open when magnet is de-energized)

Fig. 1 (electromagnet de-energized):

The pressure spring (2) lifts the valve ball (4) via pushrod (3) from the valve seat (5). Thus the passage from infeed „P“ to working line „A“ is clear.

Fig. 2 (electromagnet energized):

When the electromagnet (1) is switched on, the solenoid plunger (6) presses the valve ball (4) - via lever (7) and pushrod (8), and against the force of the pressure spring (2) and the pressure of the medium in the infeed „P“ - into the valve seat (5). Now the passage from infeed „P“ to working line “A” is blocked.

** Version "negative" = open de-energized

	MW3 infeed + working line	MW6 infeed + working line
connection bore	3	6
O-ring	9,25*1,78	12*2,5

VALVE VERSION "POSITIVE"

(Valve passage from „P“ to „A“ is closed when magnet is de-energized)

Fig. 1 (electromagnet de-energized):

The medium fed in via infeed „P“ presses the valve ball (4) into the valve seat (5), supported by the pressure spring (2). Thus the passage from infeed „P“ to working line „A“ is blocked.

Fig. 2 (electromagnet energized):

When the electromagnet (1) is switched on, the solenoid plunger (8) presses the valve ball (6) - via lever (9) and pushrod (10), and against the force of the pressure spring (2) - into the valve seat (7). Now drain „R“ is blocked. At the same time, using the spacer pin (3), the valve ball (4) is pressed out of the valve seat (5), so that the passage from infeed „P“ to working line „A“ is now clear.

VALVE VERSION "NEGATIVE"

(Valve passage from „P“ to „A“ is open when the magnet is de-energized)

fig. 1 (electromagnet de-energized)

The pressure spring (2) lifts the valve ball (4) via pushrod (11) into valve seat (5). The medium flowing from infeed „P“ to the working line supports the pressure spring action. Thus the drain „R“ is blocked and the infeed „P“ is connected to the working line „A“.

fig. 2 (electromagnet energized)

When the electromagnet (1) is switched on, the solenoid plunger (8) presses the valve ball (4) via lever (9) and pushrod (10) and against the force of the pressure spring (2) and the pressure of the medium in the infeed „P“ - into the valve seat (7). Now the infeed „P“ is blocked and the working line „A“ is connected to drain „R“.
